NOVELTY - A thermoplastic resin composition contains: (a) a polyolefin-based resin, 95-5 percent by weight; (b) a polystyrene-based resin having mainly a syndiotactic structure, 5-95 percent by weight; and at least (c) a thermoplastic elastomer, 0.5-100 parts by weight; and (d) a polyphenylene ether resin, 0.5-100 parts by weight. The weight of (c) and (d) is based on 100 parts by weight of (a) and (b).

USE - The thermoplastic resin composition is used in an automobile radiator tank, a secondary battery container.

ADVANTAGE - The thermoplastic resin composition has superior solvent resistance, resistance to water vapor permeability, and impact strength resistance, and no decrease in mechanical strength after long-term service at high temperatures. Enhanced heat resistance, impact strength resistance, and rigidity are observed in glass fiber reinforcement.
